

# Feeling key PRESSED:

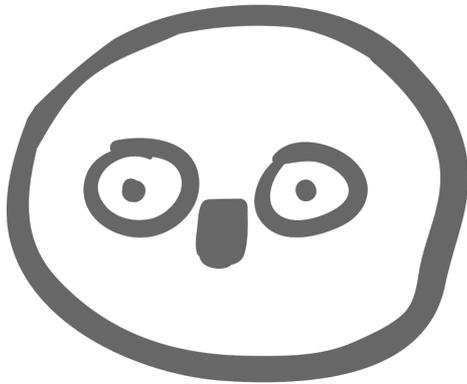

comparing the ways in which force and self-reports reveal emotion

Rubia Guerra  
Oct 2022

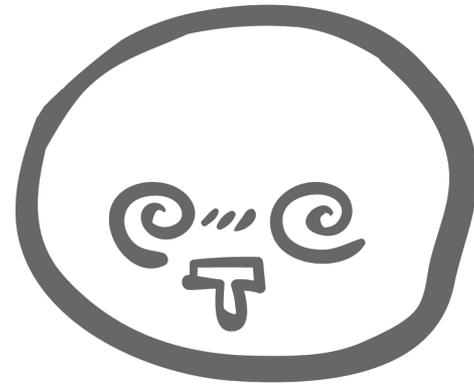

# HAVE YOU EVER FELT...

SO ECSTATIC YOU WERE OUT OF WORDS

...or so stressed that you could barely speak

YOU ARE SO CLOSE TO FINISHING YOUR DAY

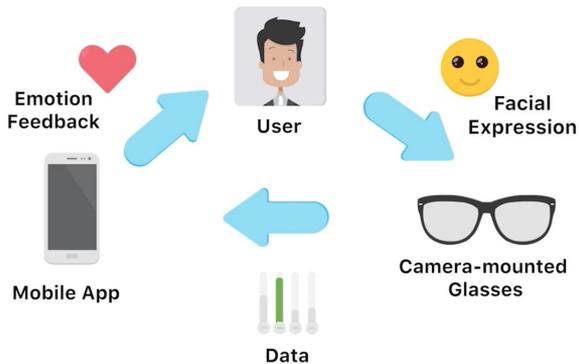

...but then you remember that you have a meeting. right.  
after. this. presentation.

**Emotions are *dynamic* and  
*complex* experiences**

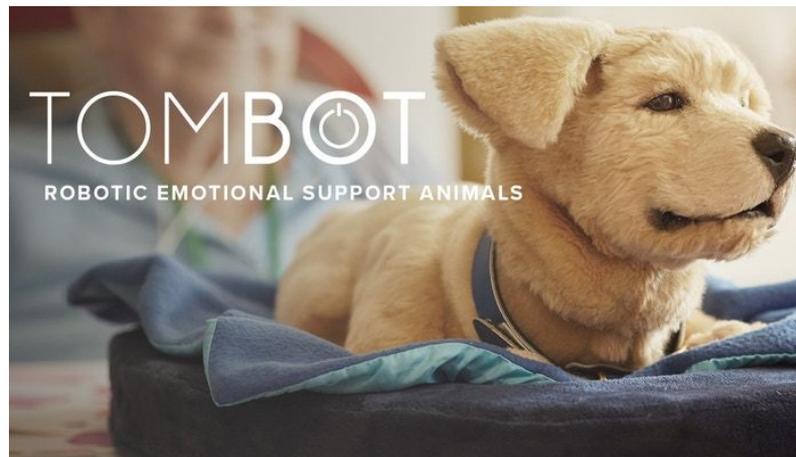

# WHY DO WE CARE ABOUT EMOTIONS?

Estimating non-"verbalized" emotion

An end-to-end AI-enabled wearable platform  
for enhancing self-awareness of emotional health

EmoGlass, Yan et al. [CHI  
2022]

Limitations

Next steps

Summary

# WHERE DO WE START?

# WHAT ARE MODELS?

Models can be:

- representational tools
- adequate and limited to a purpose

Unfortunately, no model is morally neutral

Parker, W. S., & Winsberg, E. [2018]. Values and evidence: How models make a difference. *European Journal for Philosophy of*

*Science*, 8(1), 125–142. <https://doi.org/10.1007/s13194-017-0180-6>

# COMPUTATIONAL MODELS OF EMOTION

Estimate emotion given a set of inputs

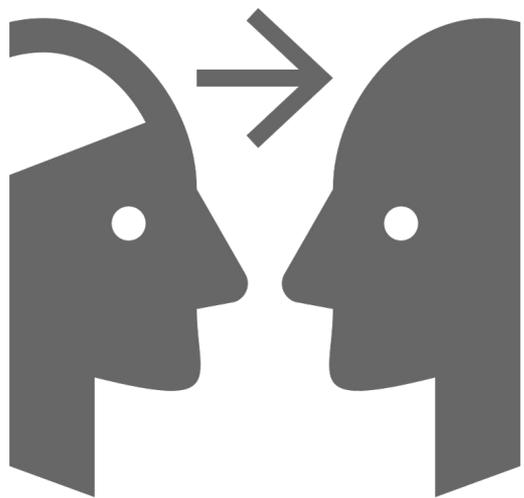

Annotated datasets to train and evaluate models

Emotion elicitation

Inputs (or affective expression modalities)

Emotion measurement instruments

Zhang, J., Yin, Z., Chen, P., & Nichele, S. (2020). Emotion recognition using multi-modal data and machine learning techniques: A tutorial and review. *Information Fusion*, 59, 103-126.

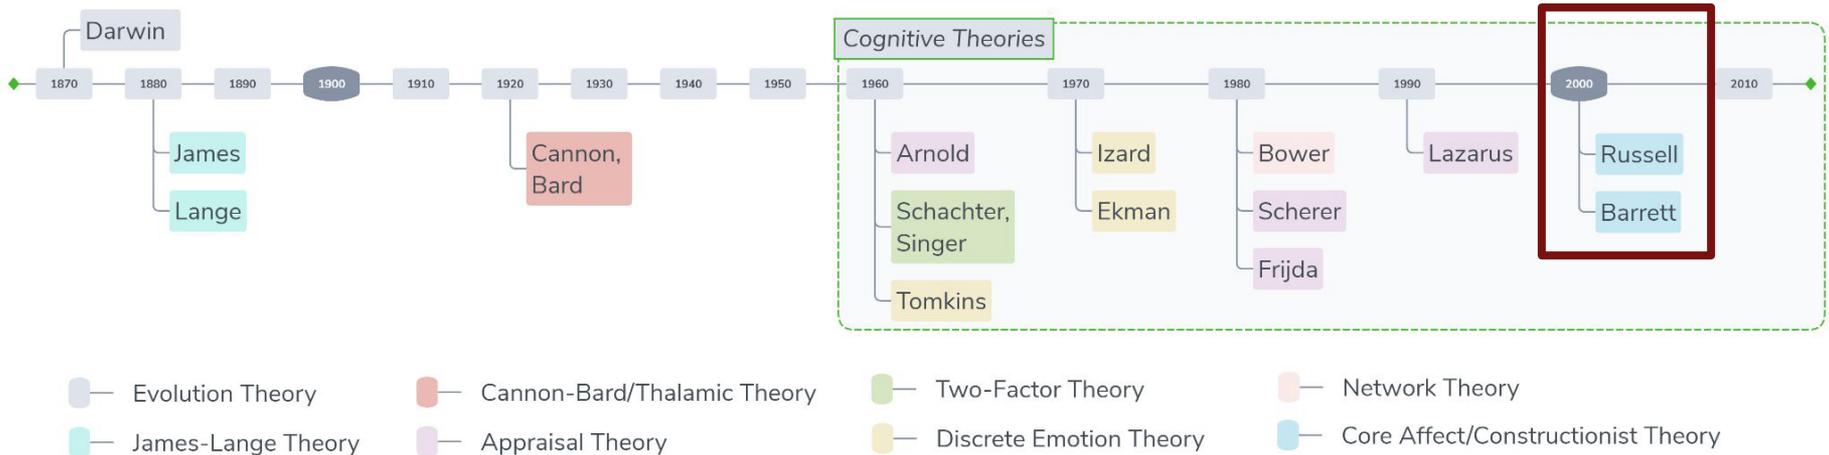

HOW DO WE START?

# UNDERSTANDING EMOTION LANGUAGE

**emotions are *dynamic* and *complex* experiences**

# ...AND SO IS OUR UNDERSTANDING OF EMOTIONS

Thanapattheerakul, T., Mao, K., Amoranto, J., & Chan, J. H. (2018). Emotion in a Century: A Review of Emotion Recognition. *Proceedings of the*

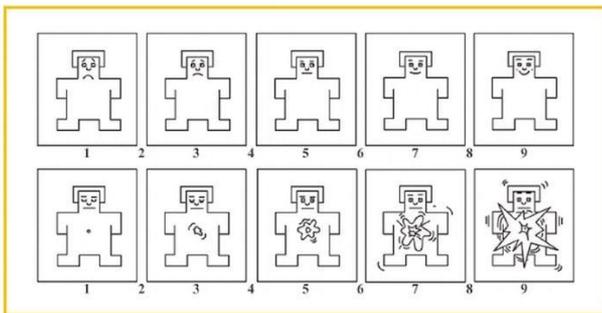

*10th International Conference on Advances in Information Technology*, 1-8. <https://doi.org/10.1145/3291280.3291788>

# SELF-REPORT FOR EMOTION MODELLING

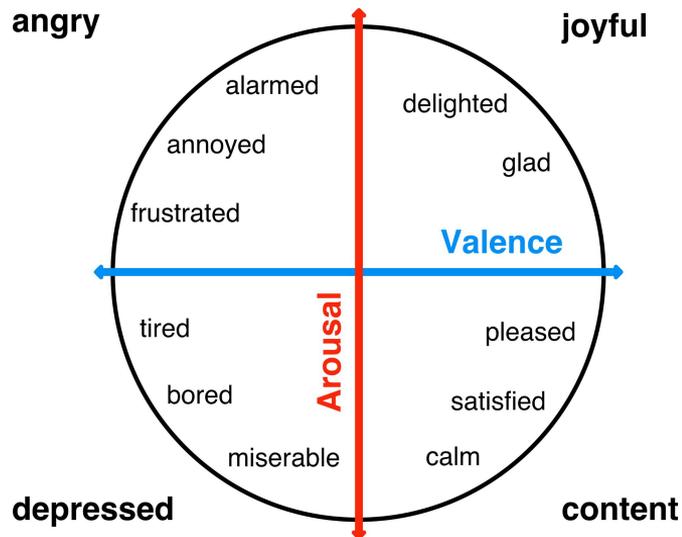

oversimplifies the experience

requires a lot of instruction

is non-exhaustive / low-density

SAM (Self-Assessment Manikin) scale

Circumplex model of affect

## METAPHORS

New representations that account for time, uncertainty, and multiplicity are needed.

## FRAMING

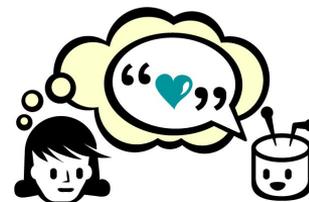

Framework needs to account for, negotiated, and reported on between people.

## METHODOLOGY

Theory and methods need to be explained for different meanings of activities, instruments.

Bucci, P. H., Cang, X. L., Mah, H., Rodgers, L., & MacLean, K. E. (2019). Real Emotions Don't Stand Still: Toward Ecologically Viable Representation of Affective Interaction.

2019 8th International Conference on Affective Computing and Intelligent Interaction (ACII), 1-7. <https://doi.org/10.1109/ACII.2019.8925534>

# FEEL DATASET

Collected in 2018

Over 400 researcher hours and ~50 participant hours

EEG and FSR data from 16 participants

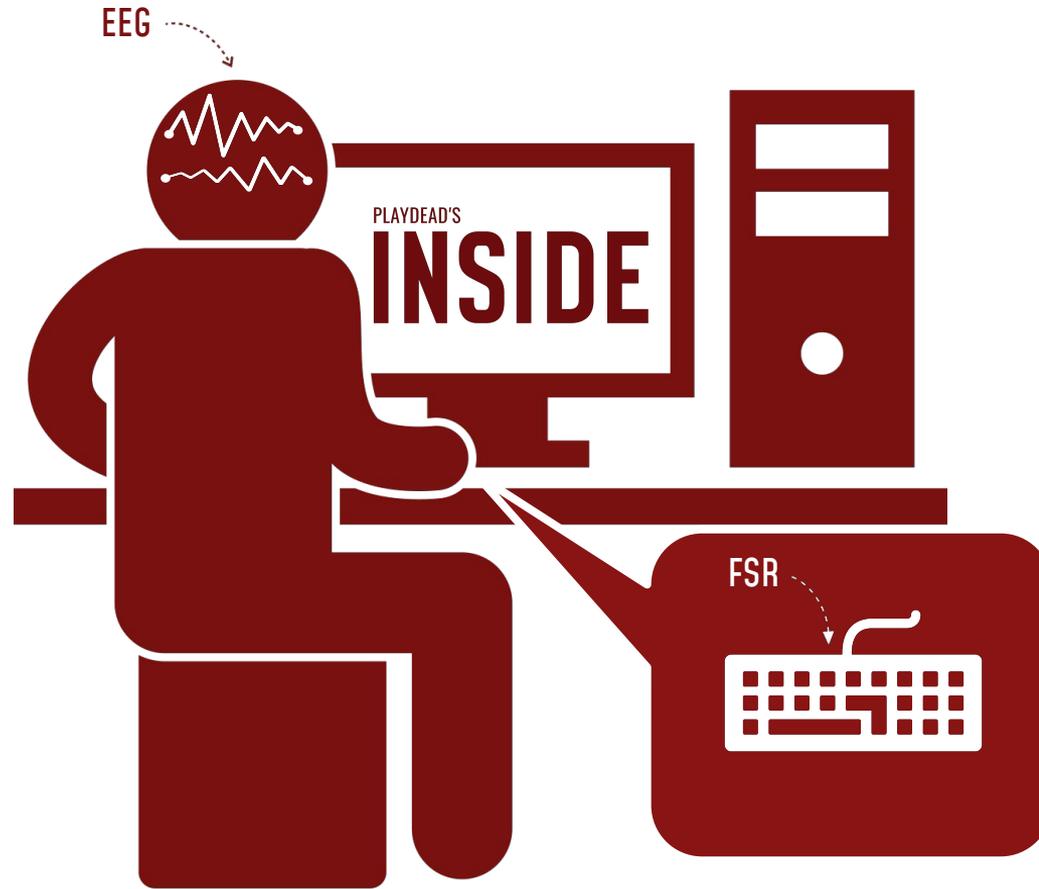

Co-designed multi-pass emotion self-reports

PRIMARY EMOTION  
ACTIVITY → EEG, FSR

TASK 2

TASK 3

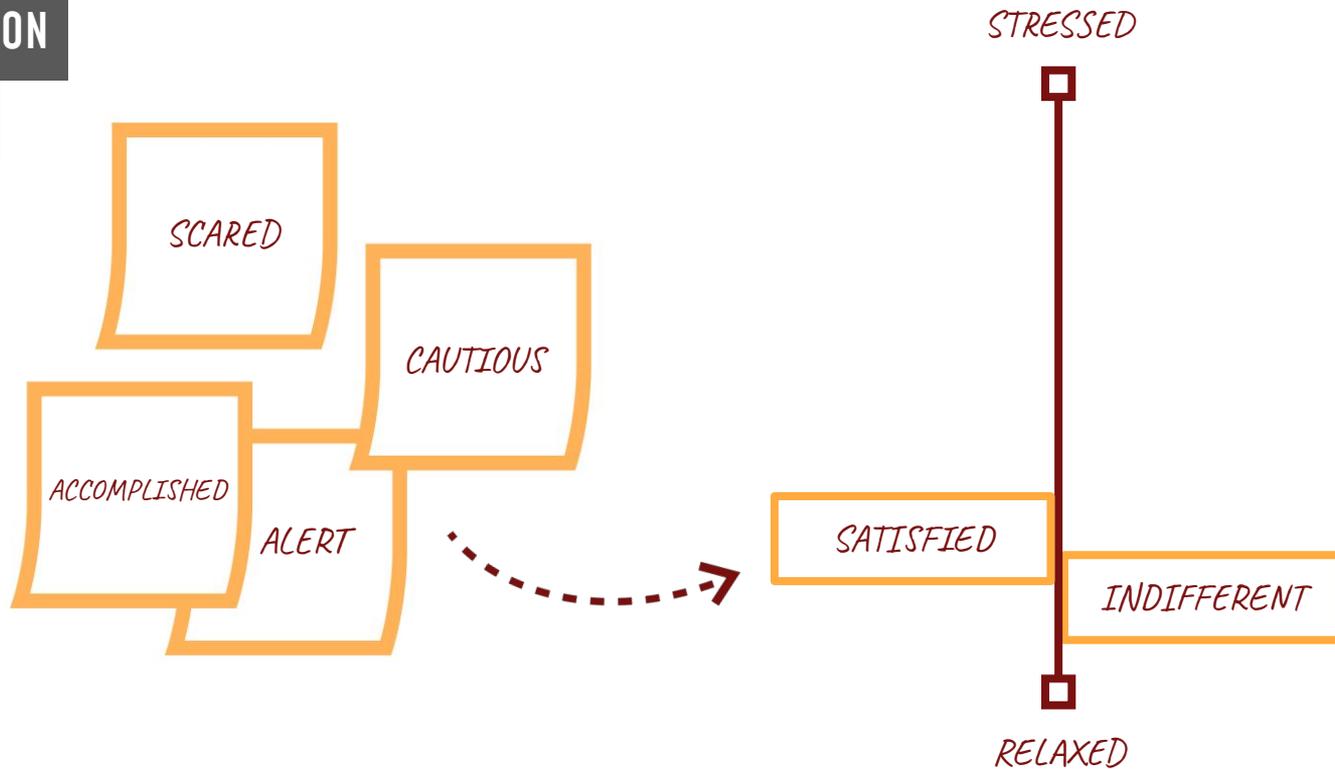

TASK 4

# EMOTION WORD CALIBRATION

TASK 3

TASK 4

Date: August 5, 2018  
Interviewer: AA  
Participant: G

scary when the 'dog code' the character → nervous.

not ~~was~~ about getting caught but how to run away.

when you're being chased → don't know when to jump.

when you see any lights near dogs etc.

when I got caught + killed.

underlying feeling throughout.

When I did know abt the truck waiting to leave.

less stressful but underlying feeling throughout.

Whenever you figure out pass a section.

throughout the game "what's the goal?"

STRESSED

RELIEVED

frustrated nervous alert cautious ambitious resigned curious satisfied hopeful

great event

STRESSED

STRESSED

RELIEVED

when I got caught the first time in the water (puddle)

when there's nothing chasing me or when it's quiet - but I was always waiting for something to pop out or a car to appear.

when I lost the sight of anyone (or any dog) chasing me + went to a quiet scene in the game.

not hopeful lots of stress

a painful caterer for cautious

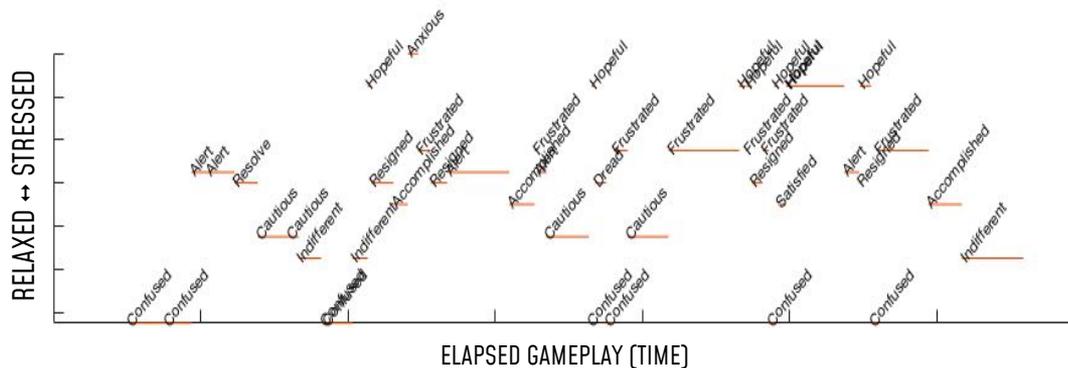

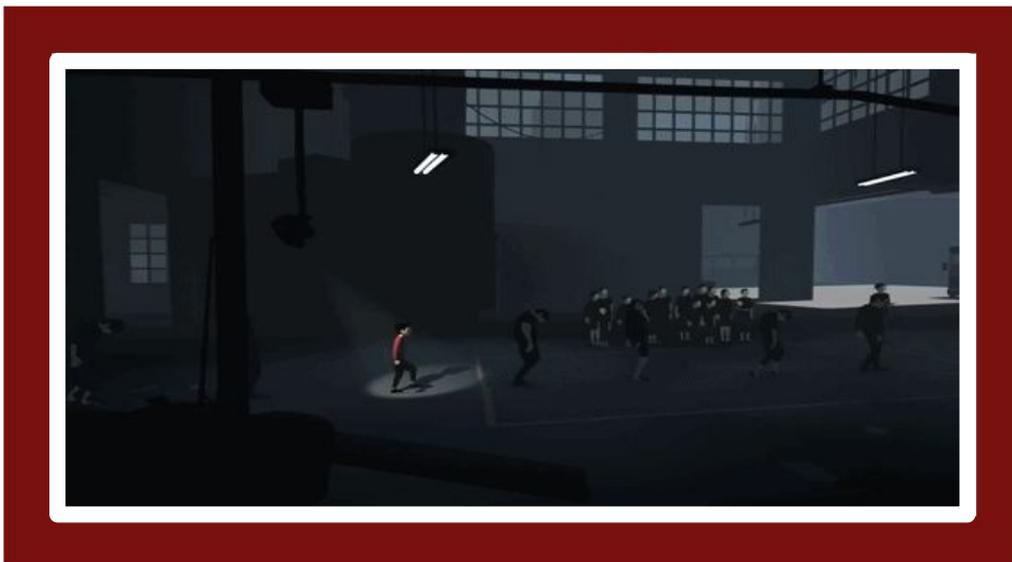

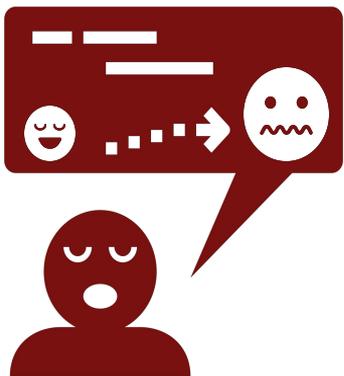

frustrated

PRIMARY EMOTION ACTIVITY → EEG, FSR

EMOTION WORD CALIBRATION

INTERVIEW → TIMELINE  
WITH CALIBRATED WORDS

TASK 4

PRIMARY EMOTION ACTIVITY → EEG, FSR

EMOTION WORD CALIBRATION

INTERVIEW → TwCW

CONTINUOUS ANNOTATION  
→ CA

# MULTI-PASS CO-CREATED SELF-REPORTS

Contextualized emotion calibration scales

Continuously annotated emotion (on emotion scales) High frequency

Emotion experience interview Low frequency

Cang, X. L., Guerra, R. R., Bucci, P., Guta, B., Rodgers, L., Mah, H., ... MacLean, K. E. (2022 [to appear]). Choose or Fuse: Enriching Data Views with Multi-Label Emotion Dynamics. IEEE 10th Int'l Conf on Affective Computing & Intelligent Interaction (ACII).

# HOW DO WE ANALYZE EMOTION DATA?

**Personalized models** emotion expression at an individual level

**More than one computational method** to analyze data

**Multiple algorithms and feature selection methods** if using Machine Learning

Azari, B., Westlin, C., Satpute, A. B., Hutchinson, J. B., Kragel, P. A., Hoemann, K., ... & Barrett, L. F. (2020). Comparing supervised and unsupervised approaches to emotion categorization in the human brain, body, and subjective experience. *Scientific reports*, 10(1), 1-17.

**[RQ1] what does keypress force tell us about emotions during tense gameplay?**

**First, what are the labels?**

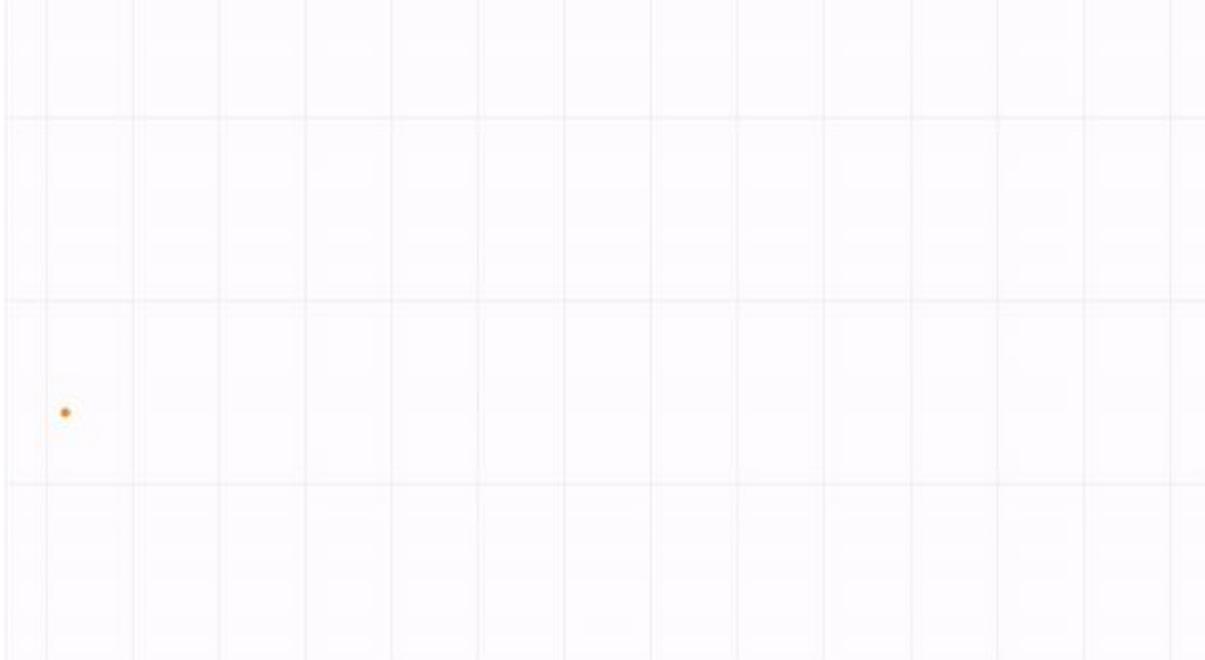

FSR

EEG

CA + TwCW

# FORCE EEG AND EMOTION-LABELLED DATASET

CA + TwCW

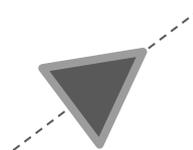

# FORCE EEG AND **EMOTION-LABELLED** DATASET

# EMOTION METAPHORS

emotion-as-position

emotion-as-direction

Cang, X. L., Guerra, R. R., Bucci, P., Guta, B., Rodgers, L., Mah, H., ... MacLean, K. E. (2022 [to appear]). Choose or Fuse: Enriching Data Views with Multi-Label Emotion Dynamics. IEEE 10th Int'l Conf on Affective Computing & Intelligent Interaction (ACII).

**RQ1: WHAT DOES KEYPRESS  
FORCE TELL US ABOUT  
EMOTIONS IN A TENSE  
GAMEPLAY?**

FSR

# FORCE EEG AND EMOTION-LABELLED DATASET

# [RQ1] APPROACH

Keypress force encodes emotion most model typing

EEG is well studied → compare FSR models to EEG

# FEEL DATASET

keypress from 5 keys (**←→↵** and **alt**)

EEG (out of scope)

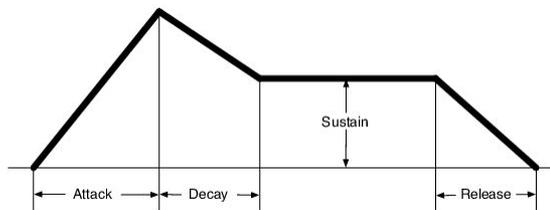

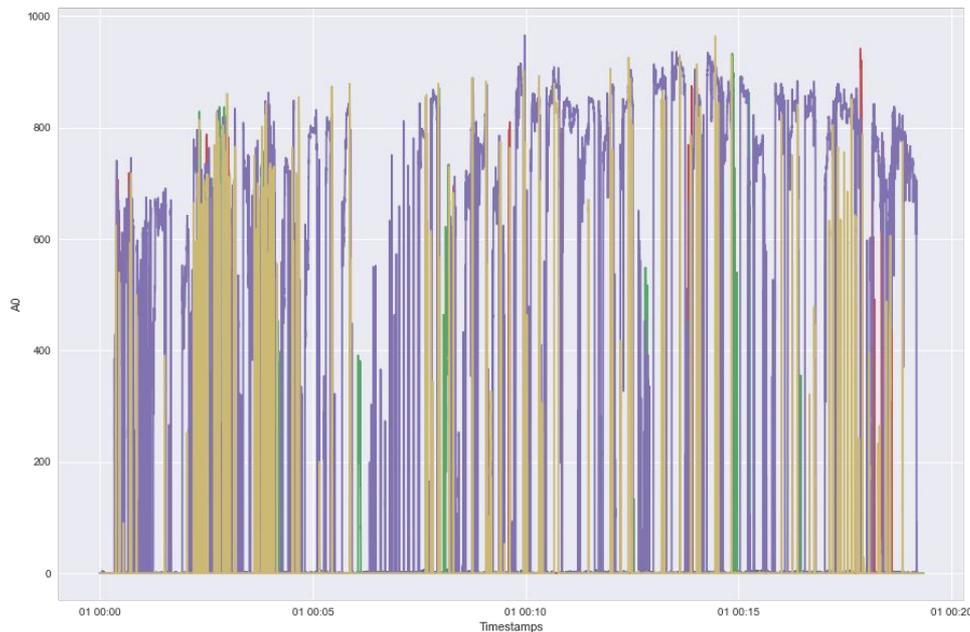

# FEATURES

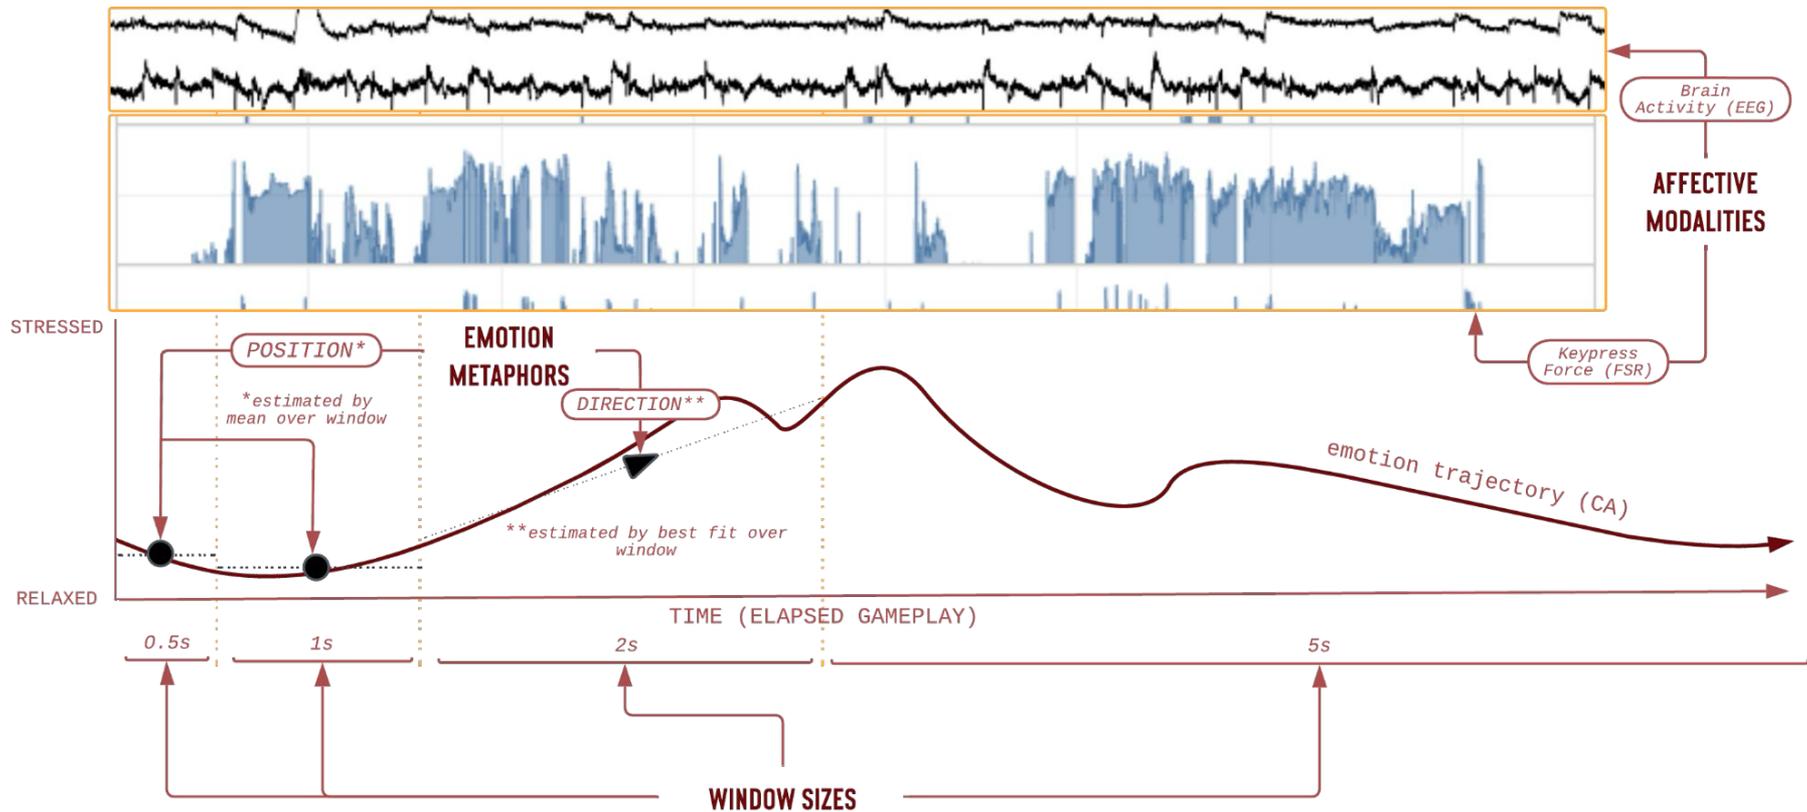

statistical analysis max, min, var, area under the curve [CANG et al., TAC'21]

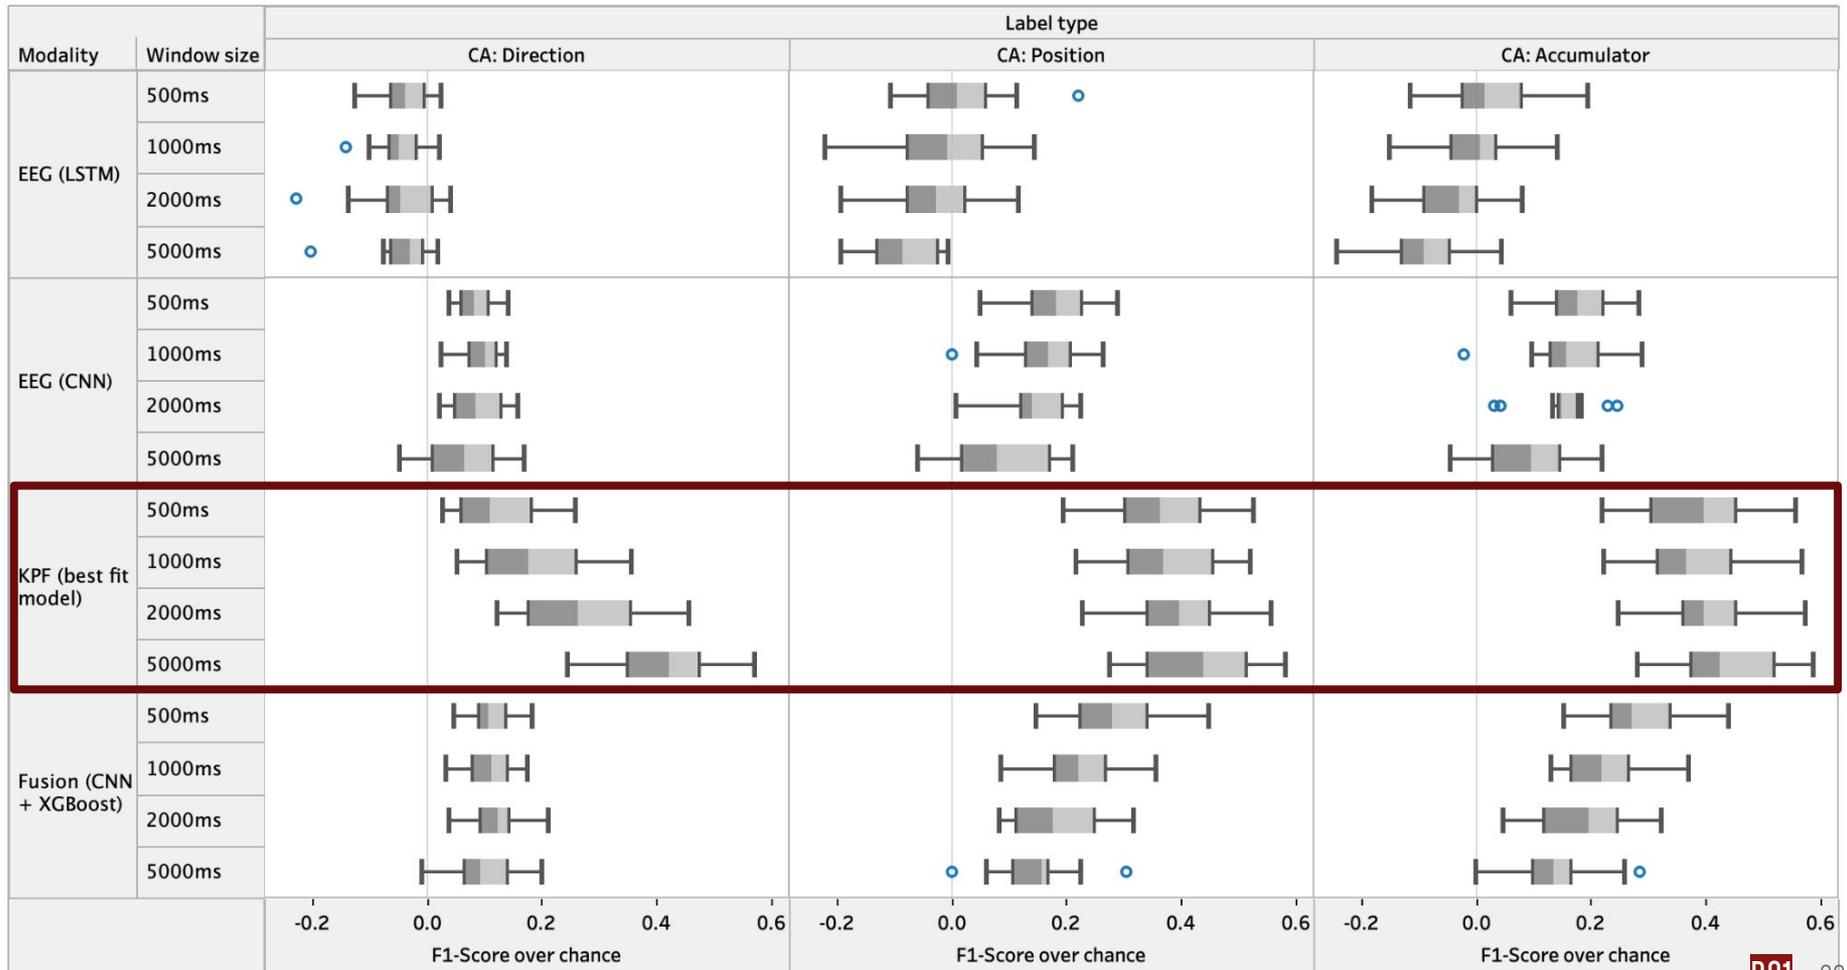

frequency analysis peak count, fundamental frequency, max amplitude, cepstral analysis [CANG et al., TAC'21]

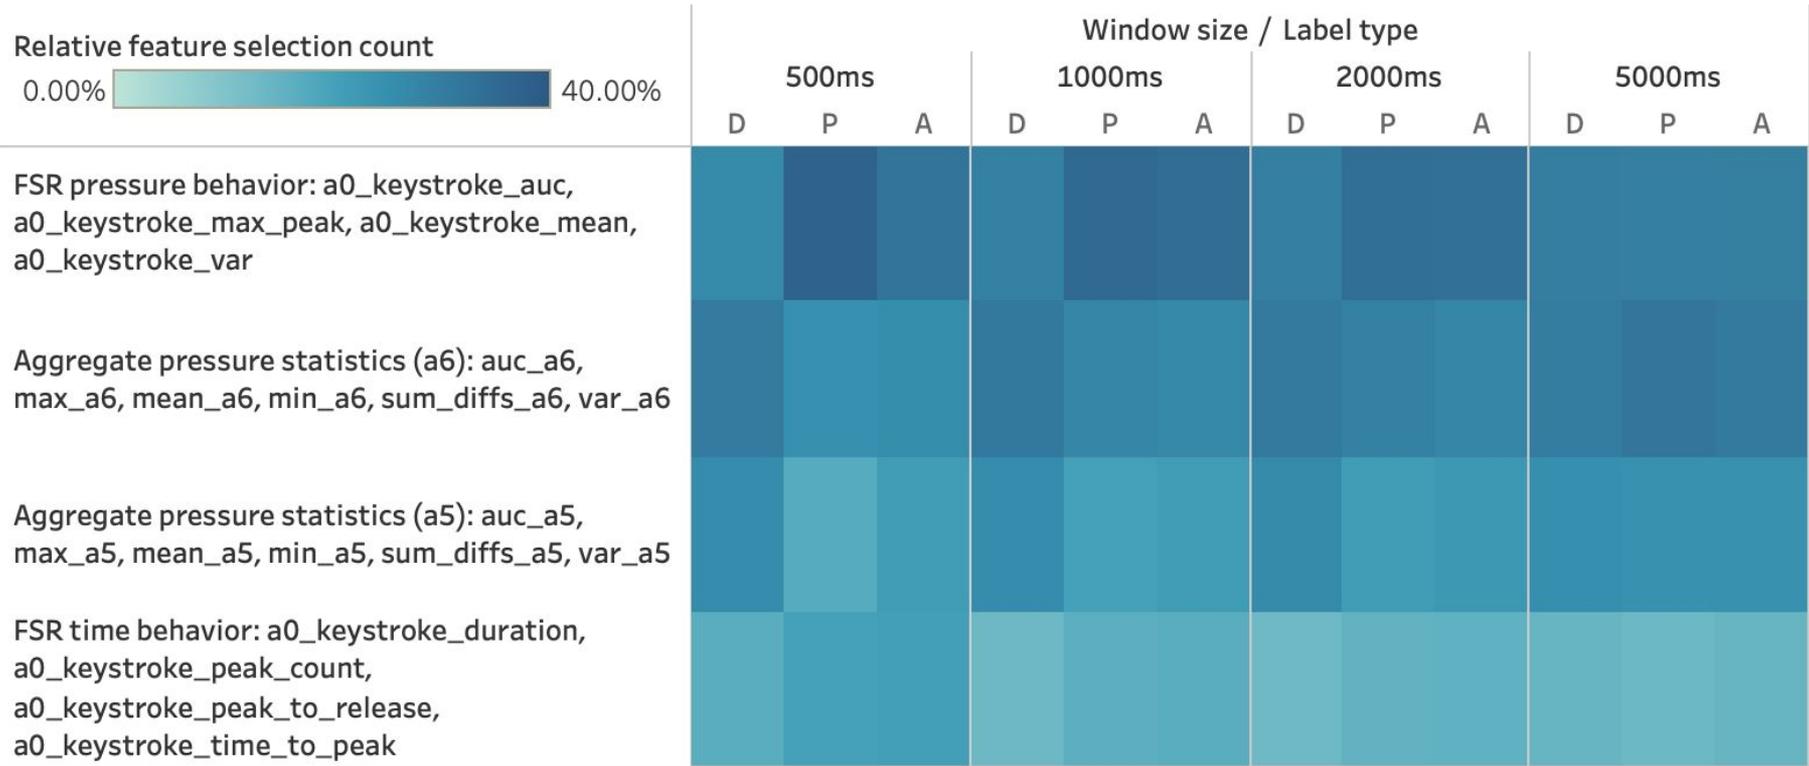

keystroke dynamics key up, key down, count of active keys [Epp et al., CHI 2011]

ADSR envelope time to peak, peak to release, keystroke duration, max peak

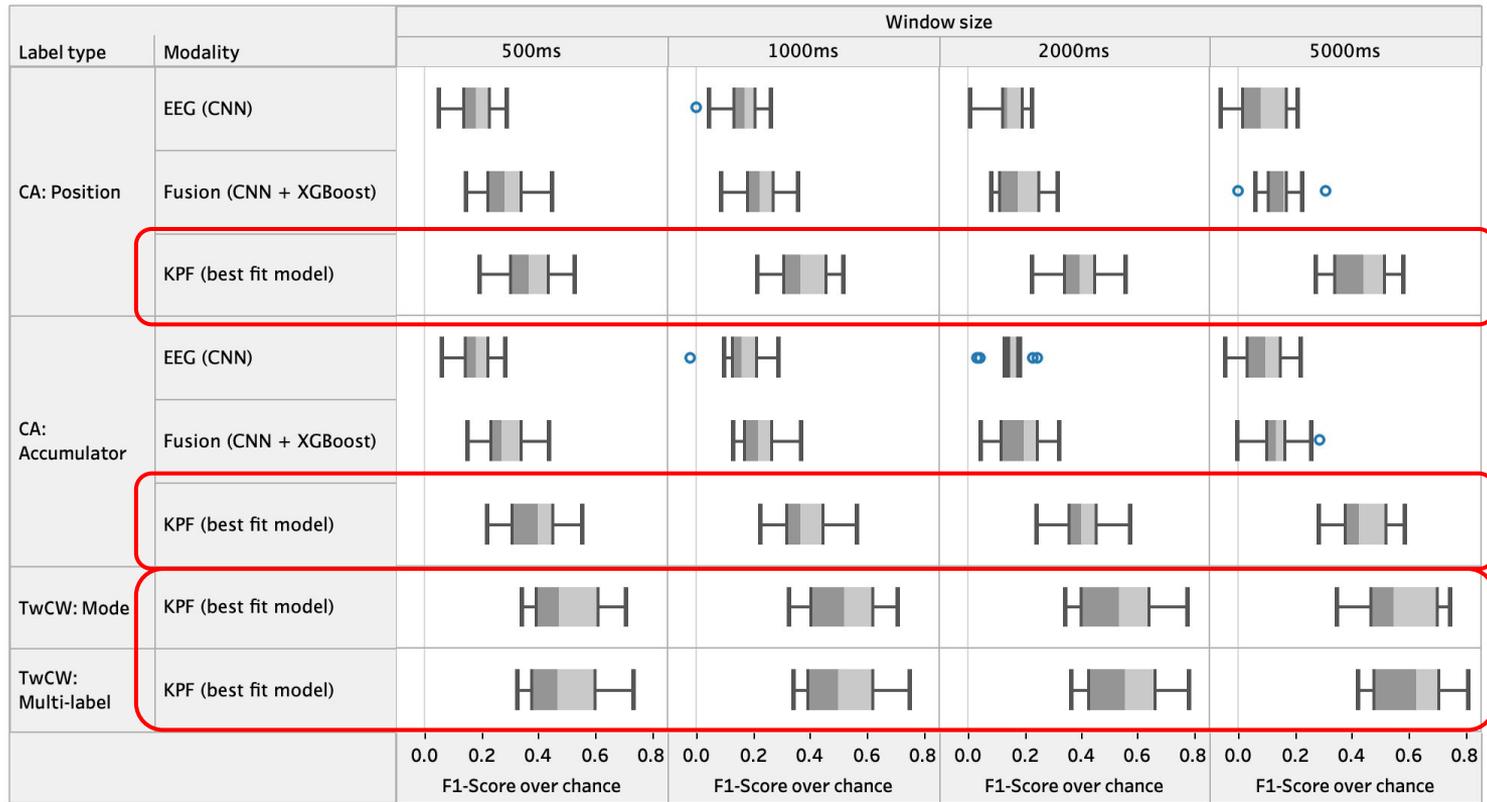

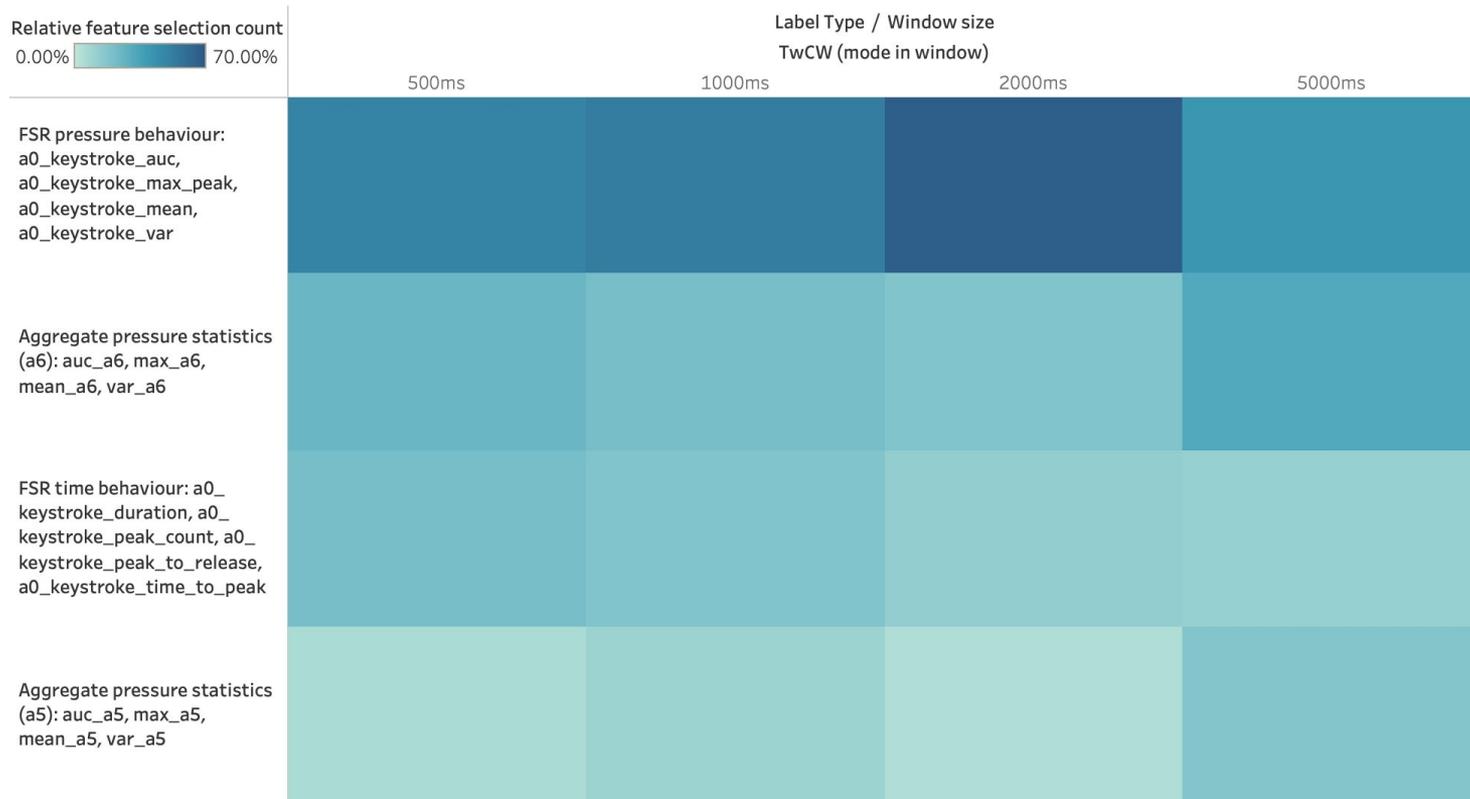

## RELATIVE FEATURE SELECTION COUNT BY WINDOW AND LABEL TYPE

Comparing TwCW and CA on emotion-as-position

## RELATIVE FEATURE SELECTION COUNT BY WINDOW AND LABEL TYPE

# WHAT DOES KEYPRESS FORCE TELL US ABOUT EMOTIONS IN A TENSE GAMEPLAY?

FSR VS. EEG VS. FUSION

**Keypress force** is a better predictor of dynamic emotion than brain **activity estimated** by EEG from comparing modalities on CA

Manual **touch pressure** encodes valuable emotion content Feature importance analysis

# **RQ2: HOW DOES ACCOUNTING FOR SUBJECTIVE AND DYNAMIC EMOTION IMPROVE COMPUTATIONAL EMOTION MODELLING?**

## [RQ2] APPROACH

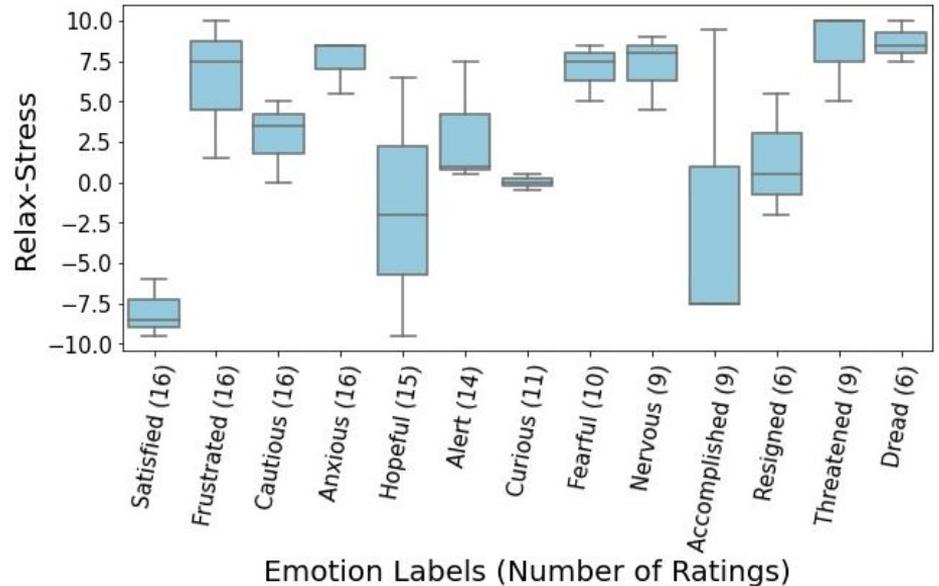

Do user-centred emotion reports add new information?

Do people rank common emotion words similarly? In what ways does labelling data differ by pass?

What are effective ways to incorporate multi-pass labels to model dynamic emotion?

# Do people rank common emotion words similarly?

Emotion word calibration inter-rater reliability test

\*Work by Chuxuan Zhang

Koo, T. K., & Li, M. Y. (2016). A guideline of selecting and reporting intraclass correlation coefficients for reliability research. *Journal of chiropractic medicine*, 15(2), 155-163.

# Do people rank common emotion words similarly?

Emotion word calibration

\*Work by Chuxuan Zhang

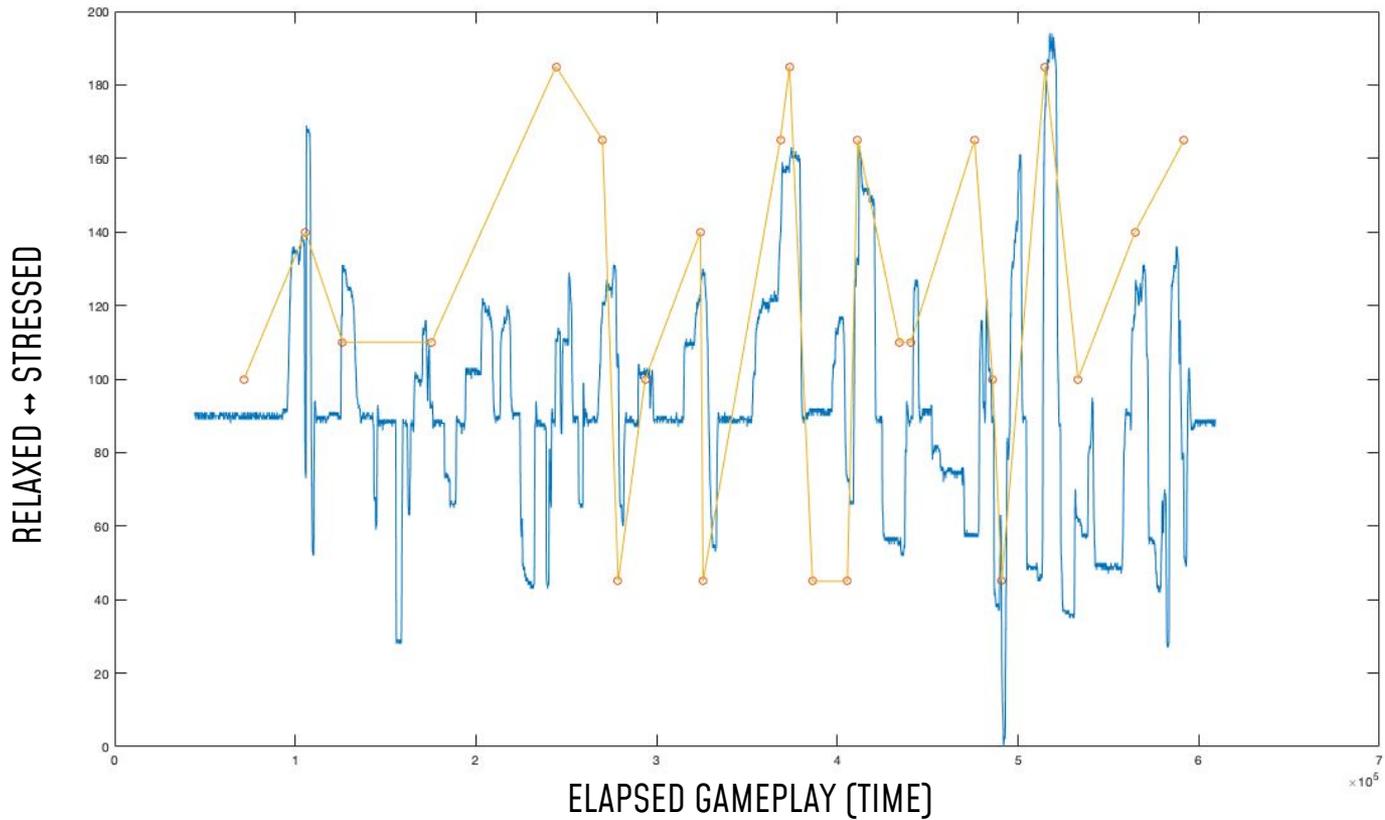

**Differences** in how individuals **interpret**  
emotion words inter-rater reliability test

highlighting the importance of  
personalized models

# Do user-centred emotion reports add new information?

Continuous annotation Downsampled at 30Hz

Timeline with Calibrated Words Less than 0.1Hz

— CONTINUOUS ANNOTATION  
[CA]

— CALIBRATED WORDS  
[TwCW]

# Do user-centred emotion reports add new information?

Continuous annotation Low-pass and downsampled at 0.05Hz

Timeline with Calibrated Words Resampled at 0.05Hz

Are CA and TwCW interchangeable? Pearson's correlation for signal similarity

Can we use CA forecast TwCW? Granger causality test

Lütkepohl, H. (2013). *Introduction to multiple time series analysis*. Springer Science & Business Media.

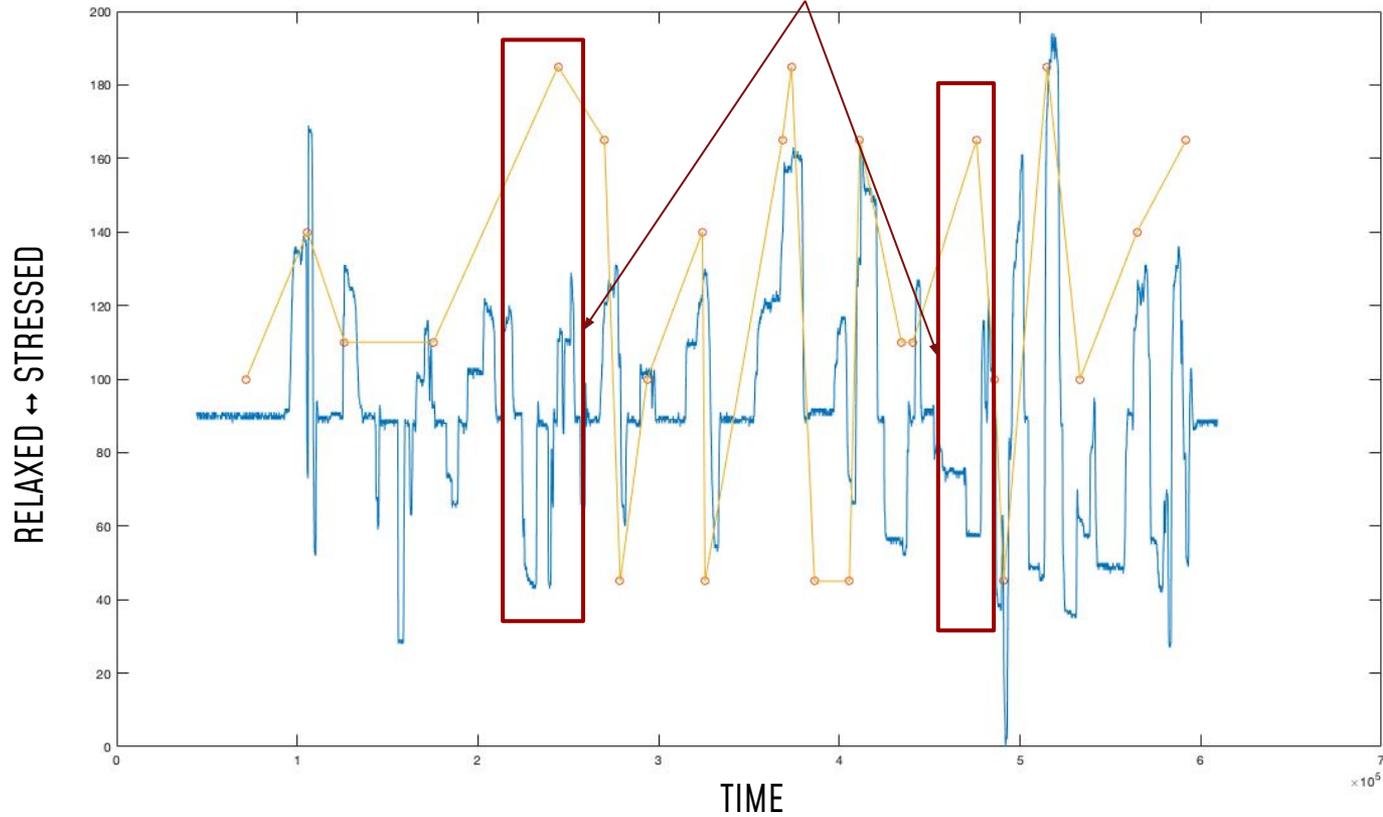

# Do user-centred emotion reports add new information?

Continuous annotation  
Timeline with calibrated words

Although individuals' self-reports **are not interchangeable** Pearson's correlation for signal similarity

both are **appropriate as responses** to the **same stimulus** Granger causality test

# INCONSISTENCIES

— CONTINUOUS ANNOTATION  
[CA]

— CALIBRATED WORDS  
[TwCW]

# What are effective ways to incorporate multi-pass labels to model dynamic emotion?

Continuous annotation position or direction

Timeline with Calibrated Words position

# What are effective ways to incorporate triangulated labels to model dynamic emotion?

INCORPORATE

Continuous annotation position or direction

Timeline with Calibrated Words position

BY

1. Combining labels
2. Extracting new information: instance probabilities
3. Resolving conflicts: label probabilities

# SINGLE PASS LABELS

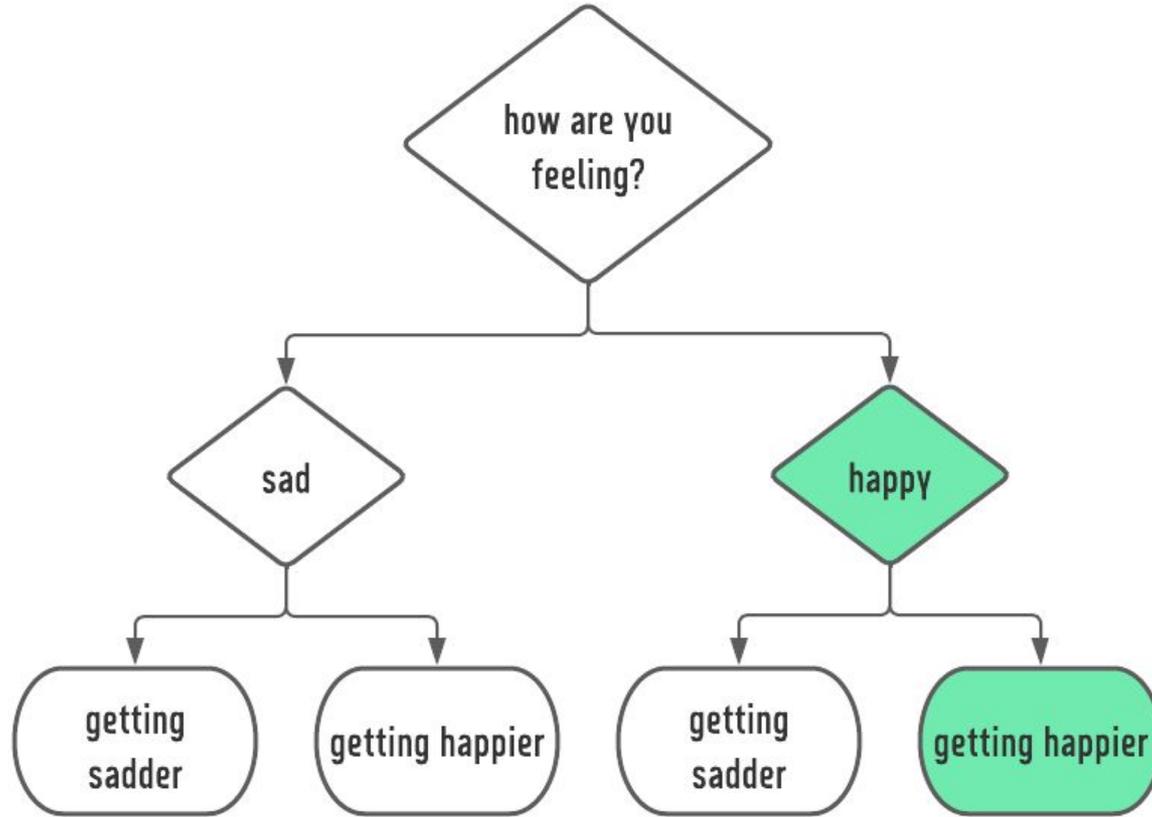

(example: Keypress Force Classification Results shown earlier)

either CA or TwCW

“standard” Machine Learning pipeline

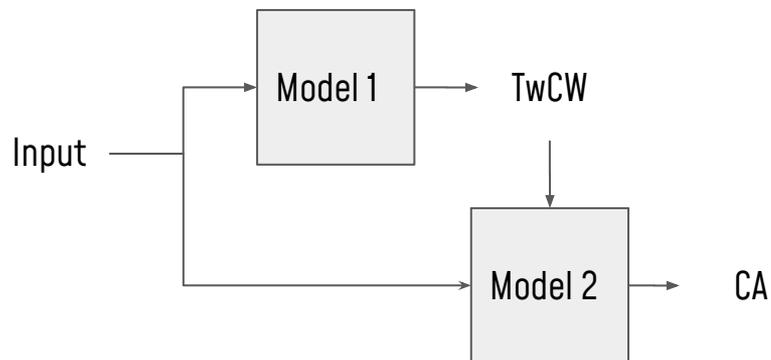

We took a hierarchical approach to three different multi-pass labeling models

# MULTI-PASS LABEL COMBINATION

What if we

output **a combination of** TwCW and CA...

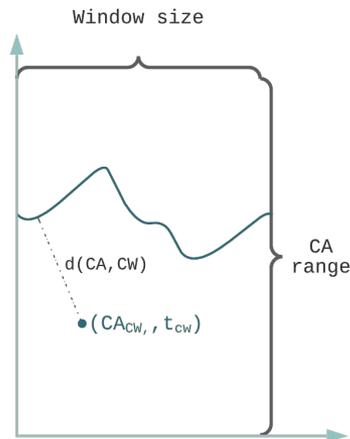

**HIERARCHICAL MULTILABEL  
MODEL**

# MULTI-PASS LABEL RESOLVING

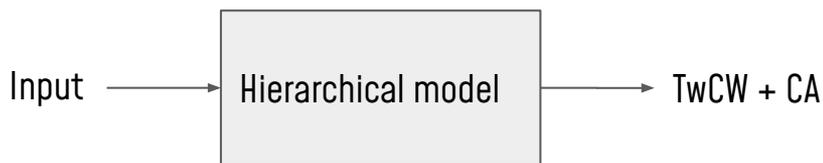

## MULTIPASS LABELS

...or a **extract information** from both CA and TwCW

$$p(\text{TwCW}|\text{CA}) = 1 - d(\text{CA}, \text{CW})$$

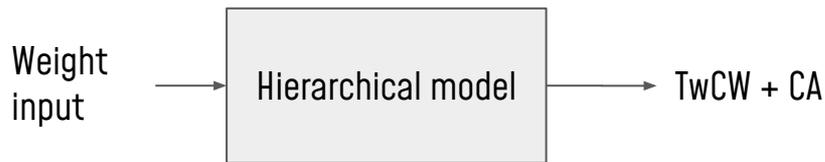

Resolving labels by using  $p(\text{TwCW}|\text{CA})$

**LABEL THRESHOLDING MODEL**

Weight inputs by using  $p(\text{TwCW}|\text{CA})$

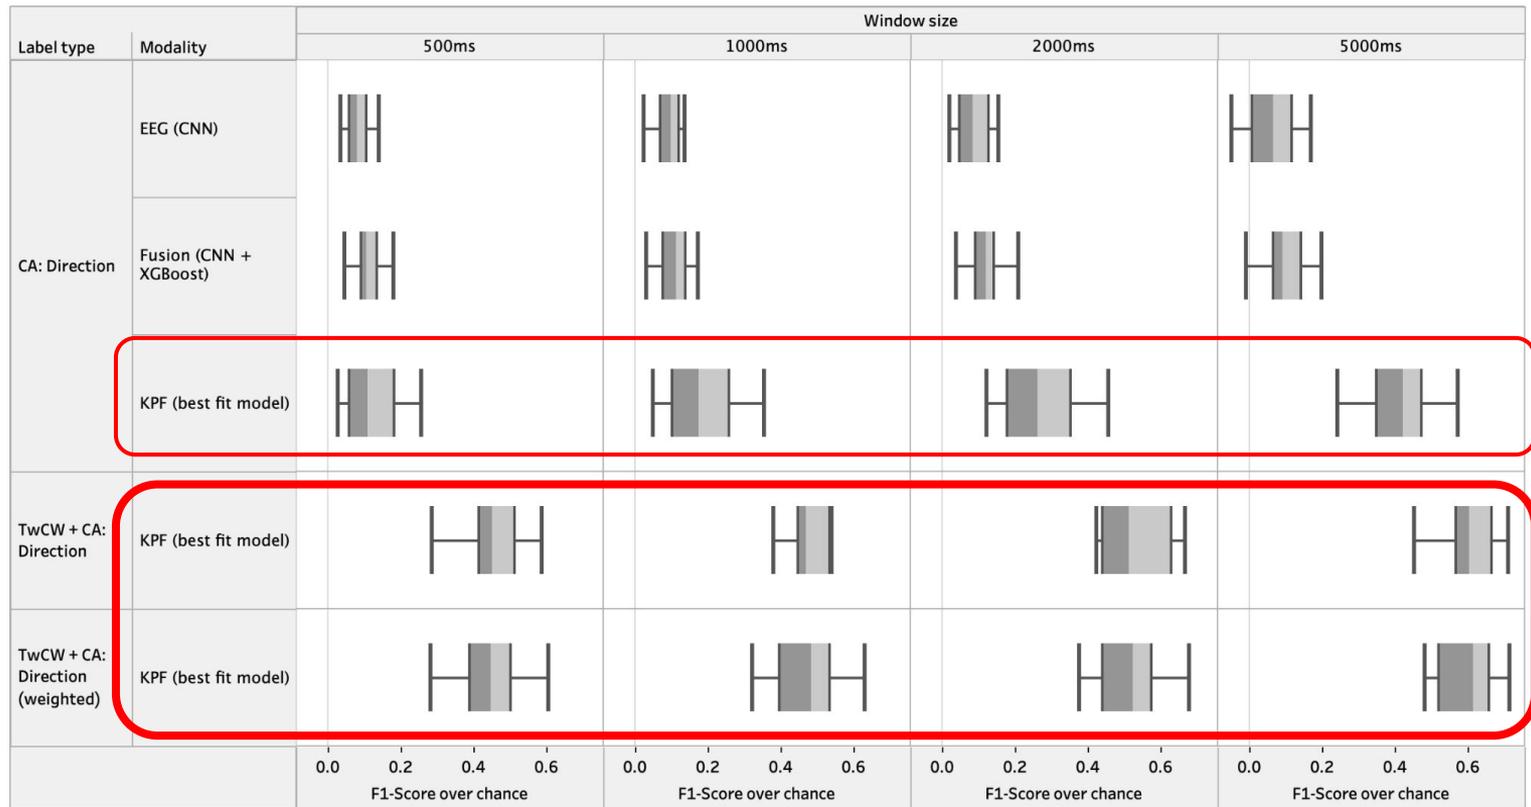

**INSTANCE THRESHOLDING MODEL**

# WHAT ARE EFFECTIVE WAYS TO INCORPORATE TRIANGULATED LABELS TO MODEL DYNAMIC EMOTION?

1. Combining self-reports
2. Extracting new labels
3. Resolving conflicts

Evaluate our proposed modelling schemes using FSR data

emotion-as-direction

# WHAT ARE EFFECTIVE WAYS TO INCORPORATE TRIANGULATED LABELS TO MODEL DYNAMIC EMOTION?

1. Combining self-reports
2. Extracting new labels
3. Resolving conflicts

Emotion words are sparse, but **meaningful** Better emotion-as-position with TwCW

**Combining** self-reports **boosts performance** and enables better **contextualized outputs** Hierarchical

classification with CA + TwCW

# LIMITATIONS

1D touch

Scope

Single emotion scale

Calibration change?

## NEXT STEPS: TOUCHTALES

Pre- and post-calibration

Multiple self-reports

Different scales

Repeated sessions

Participant emotion baseline + personal context

Spontaneous 2D touch

with pressure and *potentially* sheer NOVEL!

## EVERYTHING IN A SLIDE

Analyzed data from FEEL

- ↳ Manual touch pressure encodes valuable emotion content
- ↳ Multiple self-report passes are hard work, but it pays off
- ↳ New study coming soon, be our participant
